Hadron Spectroscopy at Belle II

Oct 02, 2020

Bryan Fulsom (PNNL)
on behalf of the Belle II Collaboration

Snowmass RPF Townhall Meeting

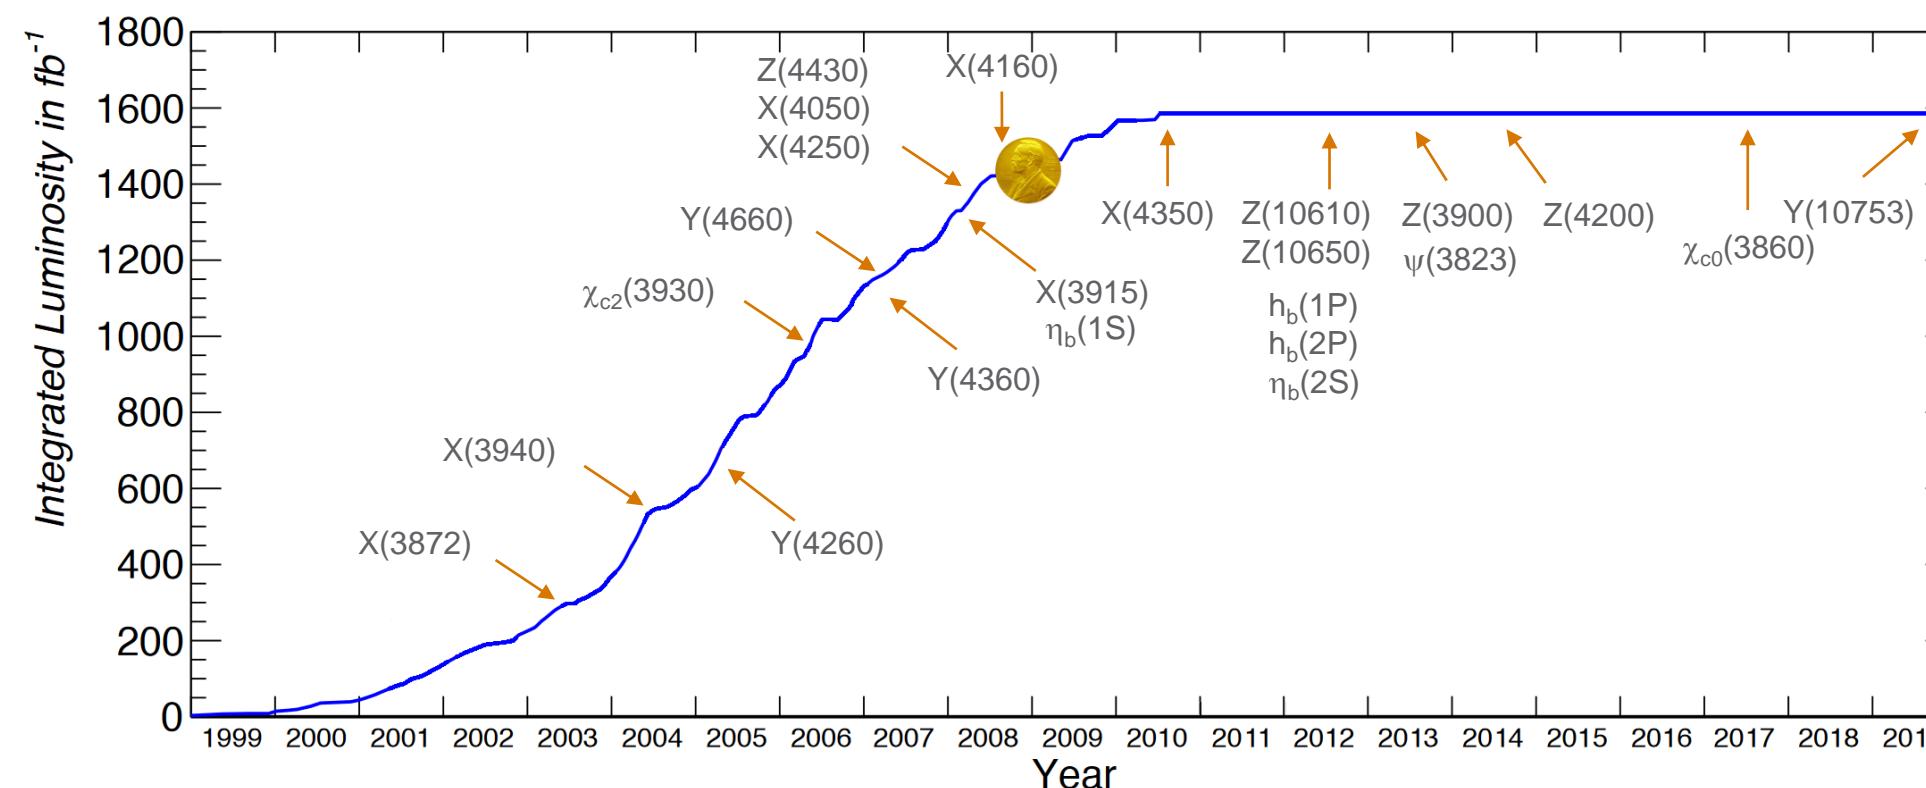

U.S. DEPARTMENT OF
ENERGY **BATTELLE**

PNNL is operated by Battelle for the U.S. Department of Energy

B-Factories Legacy

- ~2000 – 2010 : BaBar (SLAC) & Belle (KEK)
- Flavor physics: CKM/UT, CPV in B decays, hints for NP in rare processes
- New particle discoveries: “XYZ” states, conventional q \bar{q} /mesons/baryons

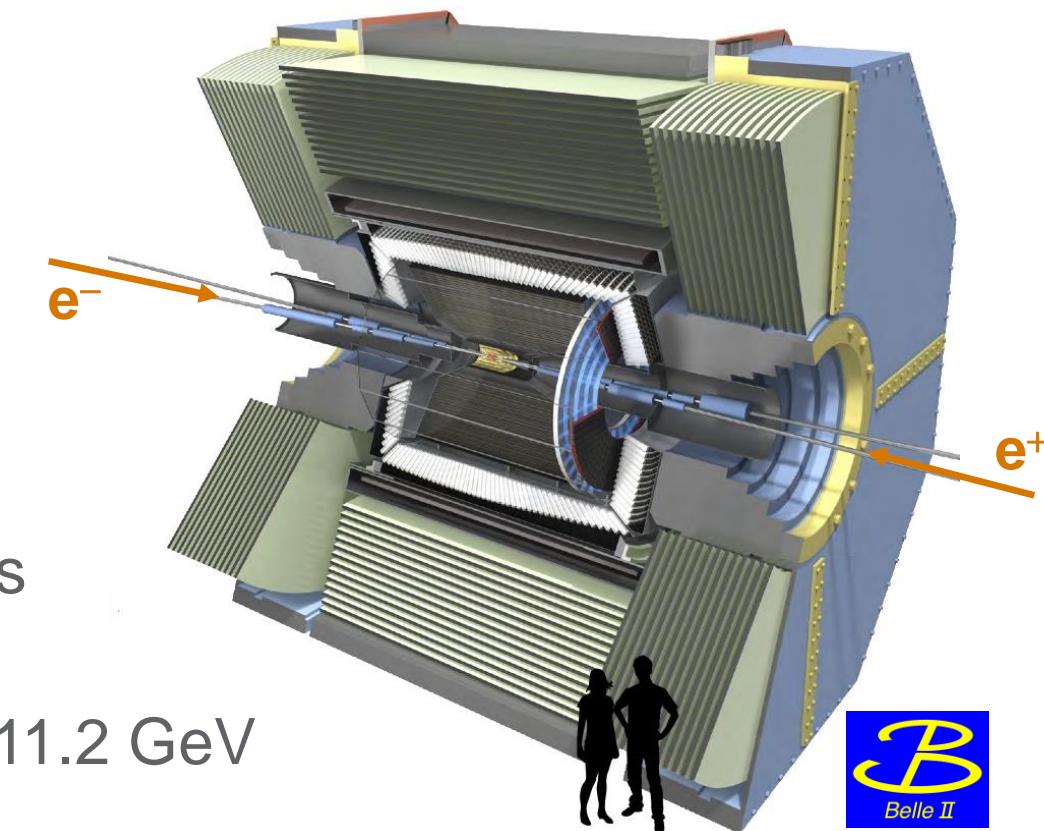

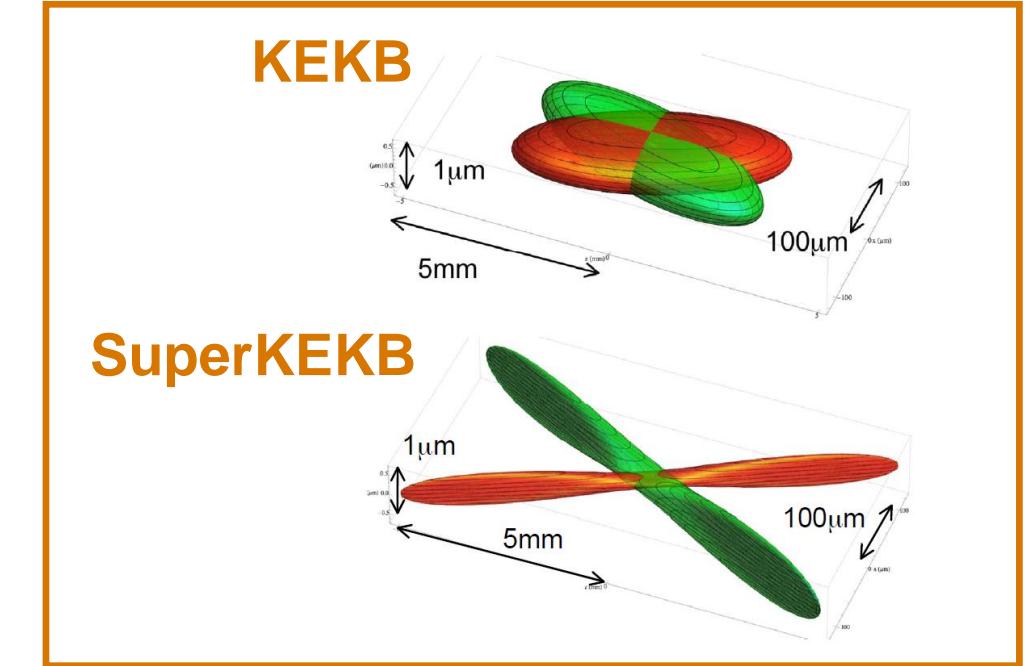

e.g.: “The Physics of the B Factories”, EPJC 74, 3026 (2014)

Belle II Capabilities

- Belle II is the next generation B-Factory
 - ~1000 members (~100 US @ 18 institutions)
 - ~10-year program ongoing since last year
- Upgraded detector and accelerator
- Extensive hadronic spectroscopy program
- Advantages
 - 50x instantaneous and integrated luminosity
 - Full event reconstruction and decays involving neutrals
 - Multiple production mechanisms for exotics
 - Nominal $\sqrt{s} = 10.58 \text{ GeV} = \Upsilon(4S)$, potential to reach $\sim 11.2 \text{ GeV}$

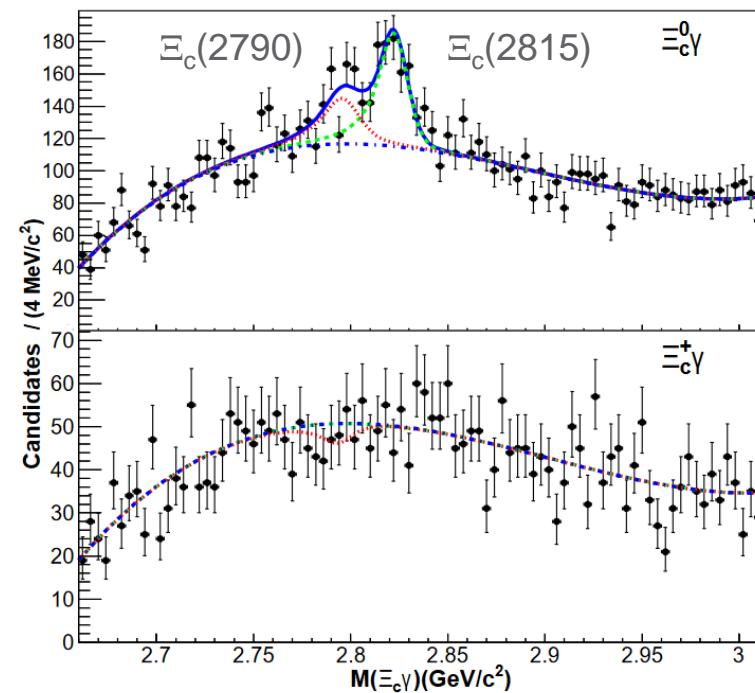

PTEP 2019 123C01 (2019)

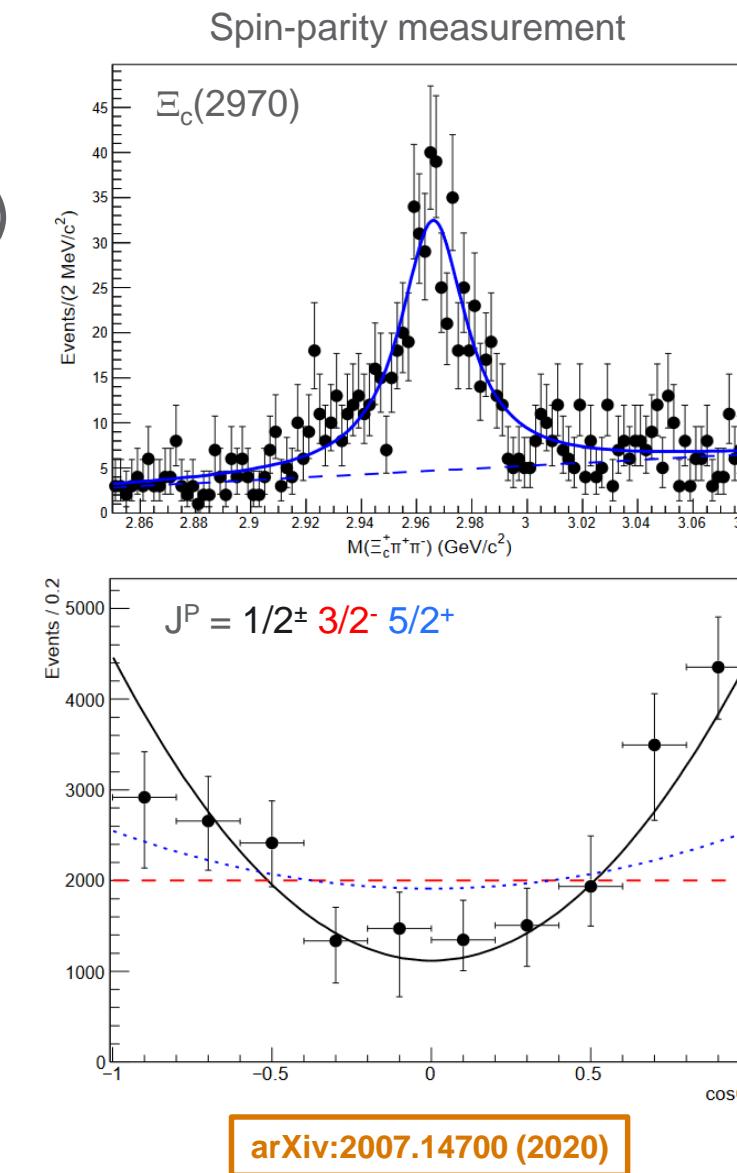

arXiv:1011.0352 (2011)

Baryons

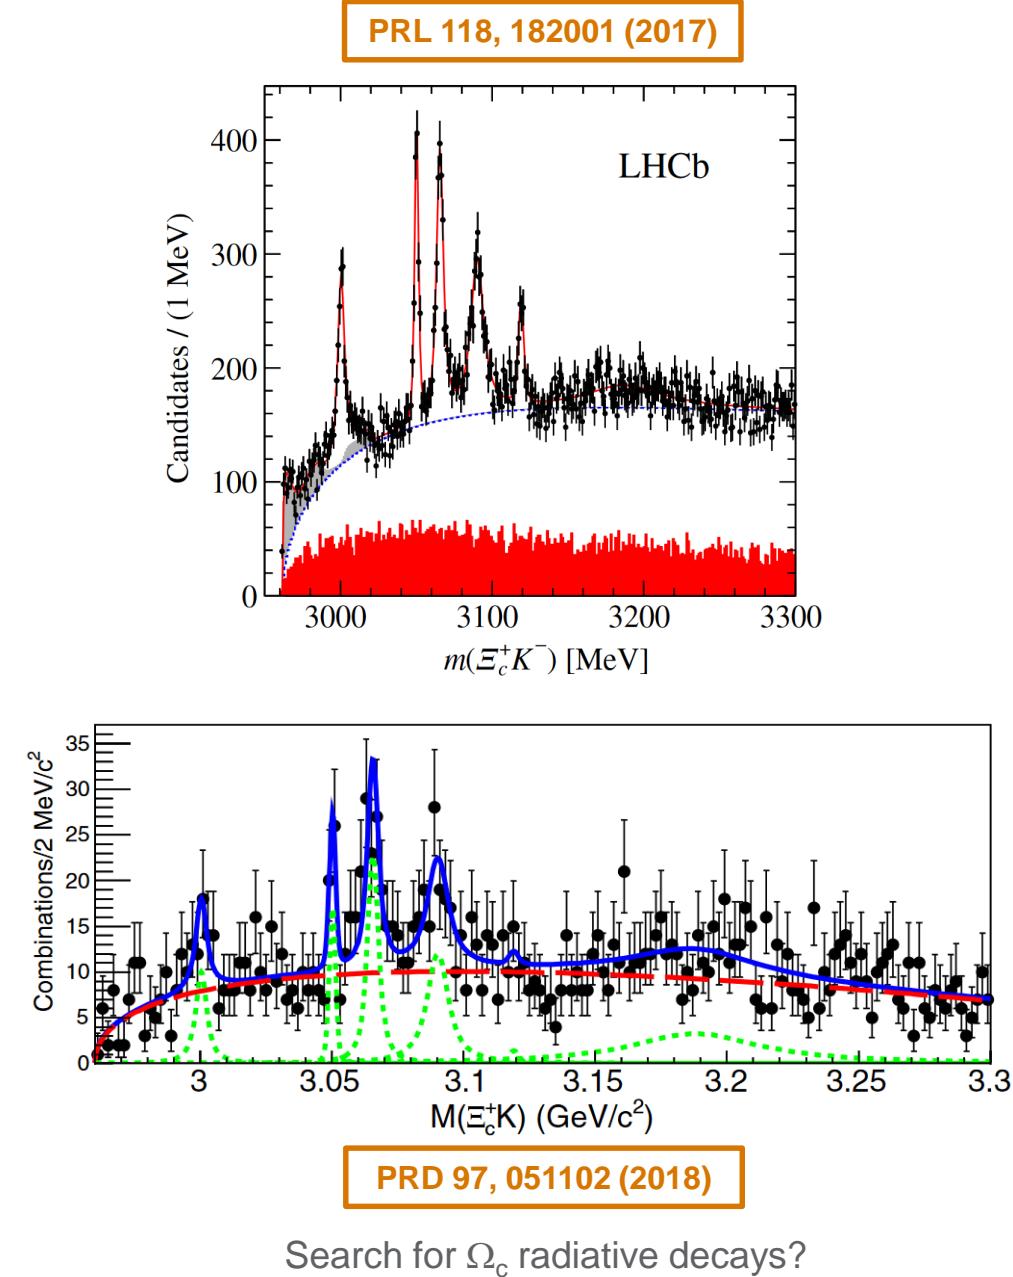

- Belle II advantages
 - Decays with neutrals (γ, π^0)
 - Spin-parity measurements
 - Weak decays of hyperons

arXiv:2009.03951 (2020)

arXiv:2007.14700 (2020)

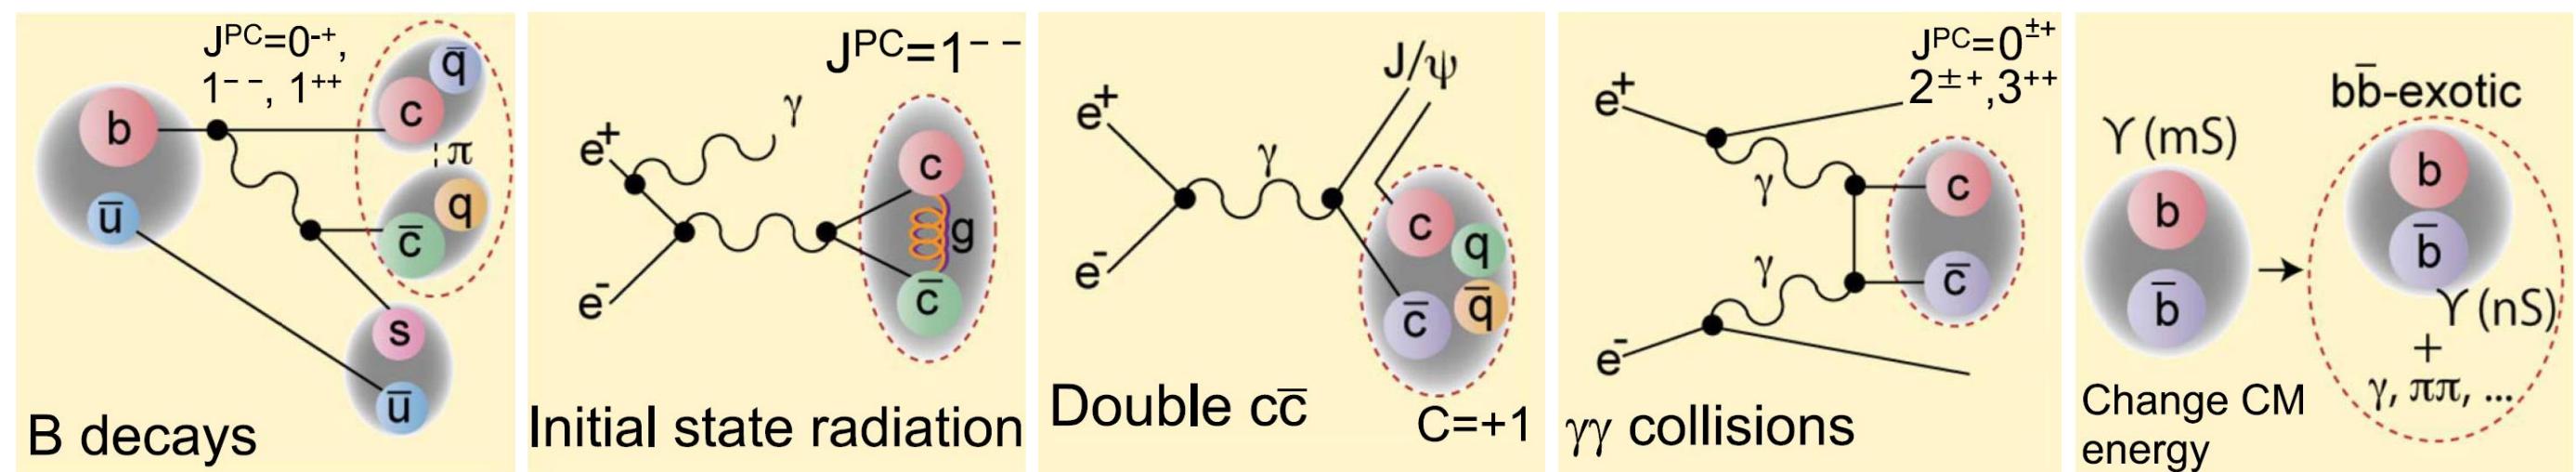

PRL 118, 182001 (2017)

PRD 97, 051102 (2018)

Production Mechanisms: Exotic and Conventional Quarkonium

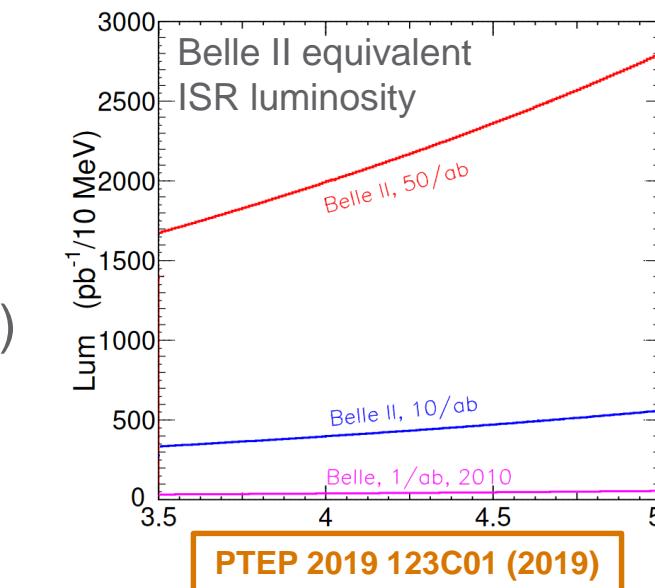

- Multiple methods to produce quarkonium/exotics at Belle II

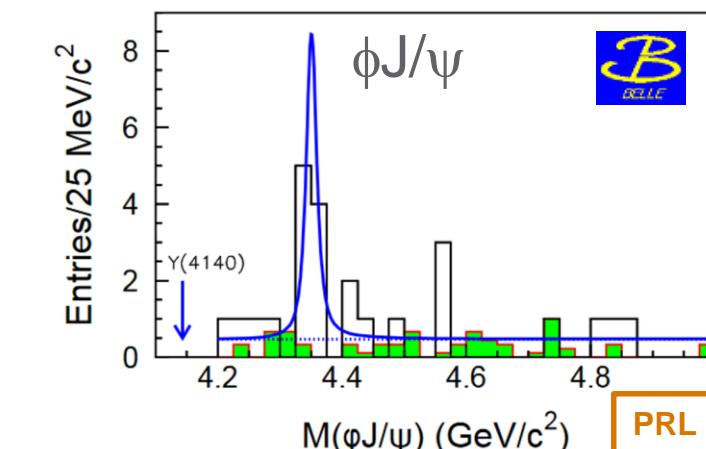

- Production mode provides important information (e.g. J^{PC} , type)
- Several of these are unique to e^+e^- colliders / Belle II

Charmonium / XYZ

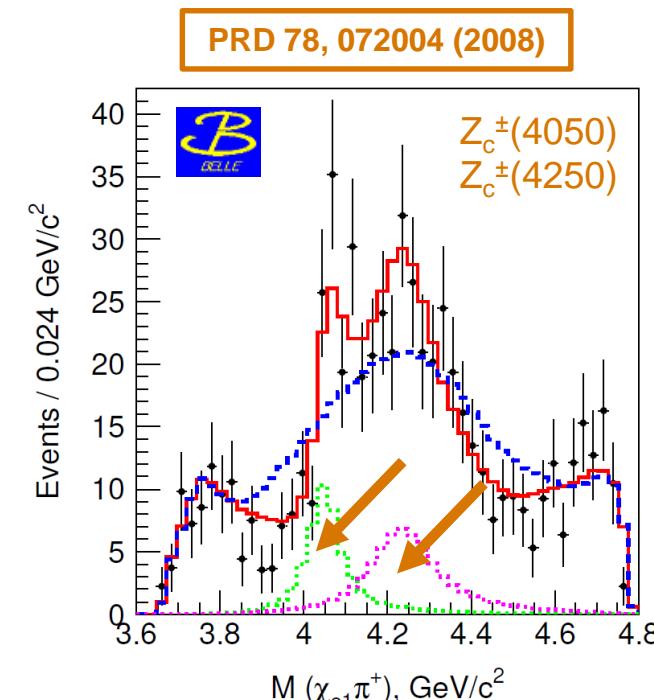

- X(3872): BF[B → X(3872,3915) K], confirmation of $\Gamma_{X(3872)}$ with $D^0\bar{D}^0\pi^0$
- Y_c States (4220, 4320, 4390, 4660, ...)
 - Complementary to E_{CM} scans
 - Improved $\sigma(e^+e^- \rightarrow \gamma_{ISR}(cc)(x))$
 - Higher ($E>4$ GeV) masses/channels (e.g. $\gamma_{ISR}\Sigma_c\Sigma_c$)
- Z_c States (3900, 4020, 4200, ...)
 - Confirmation and search for neutral partners
 - B decay and ISR Y_c decay production modes
- Other
 - $\phi J/\psi$ in $\gamma\gamma$ production ($Y(4140)$ et al.)
 - Conventional searches (η , ψ D-states, etc.)
 - Inclusive production in e^+e^- and γ decays

PTEP 2019 123C01 (2019)

PRL 104, 112004 (2010)

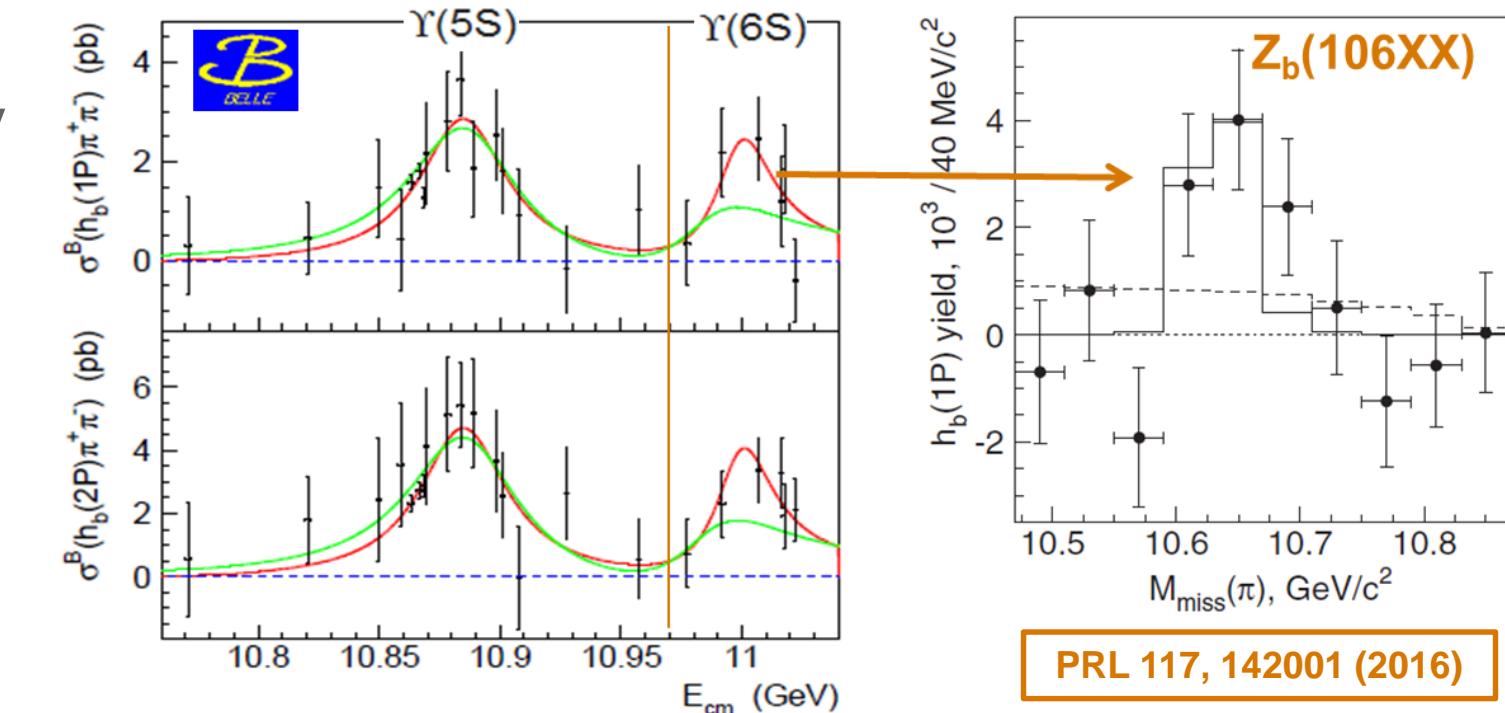

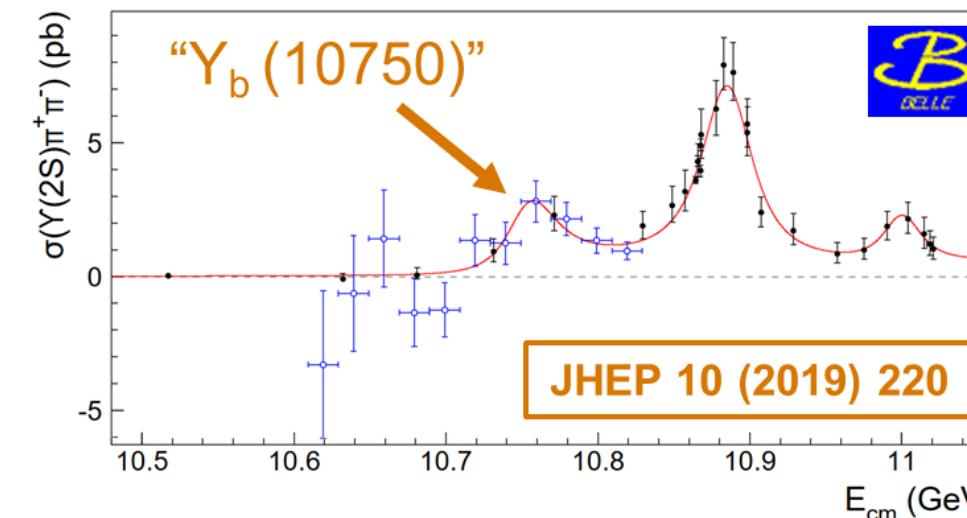

PRD 78, 072004 (2008)

Bottomonium / XYZ

- Exotic states

- $Z_b^\pm(10610/50)$: study at $\Upsilon(5S/6S)$ energy
- $\Upsilon_b(10750)$: enhancement in E_{CM} scan

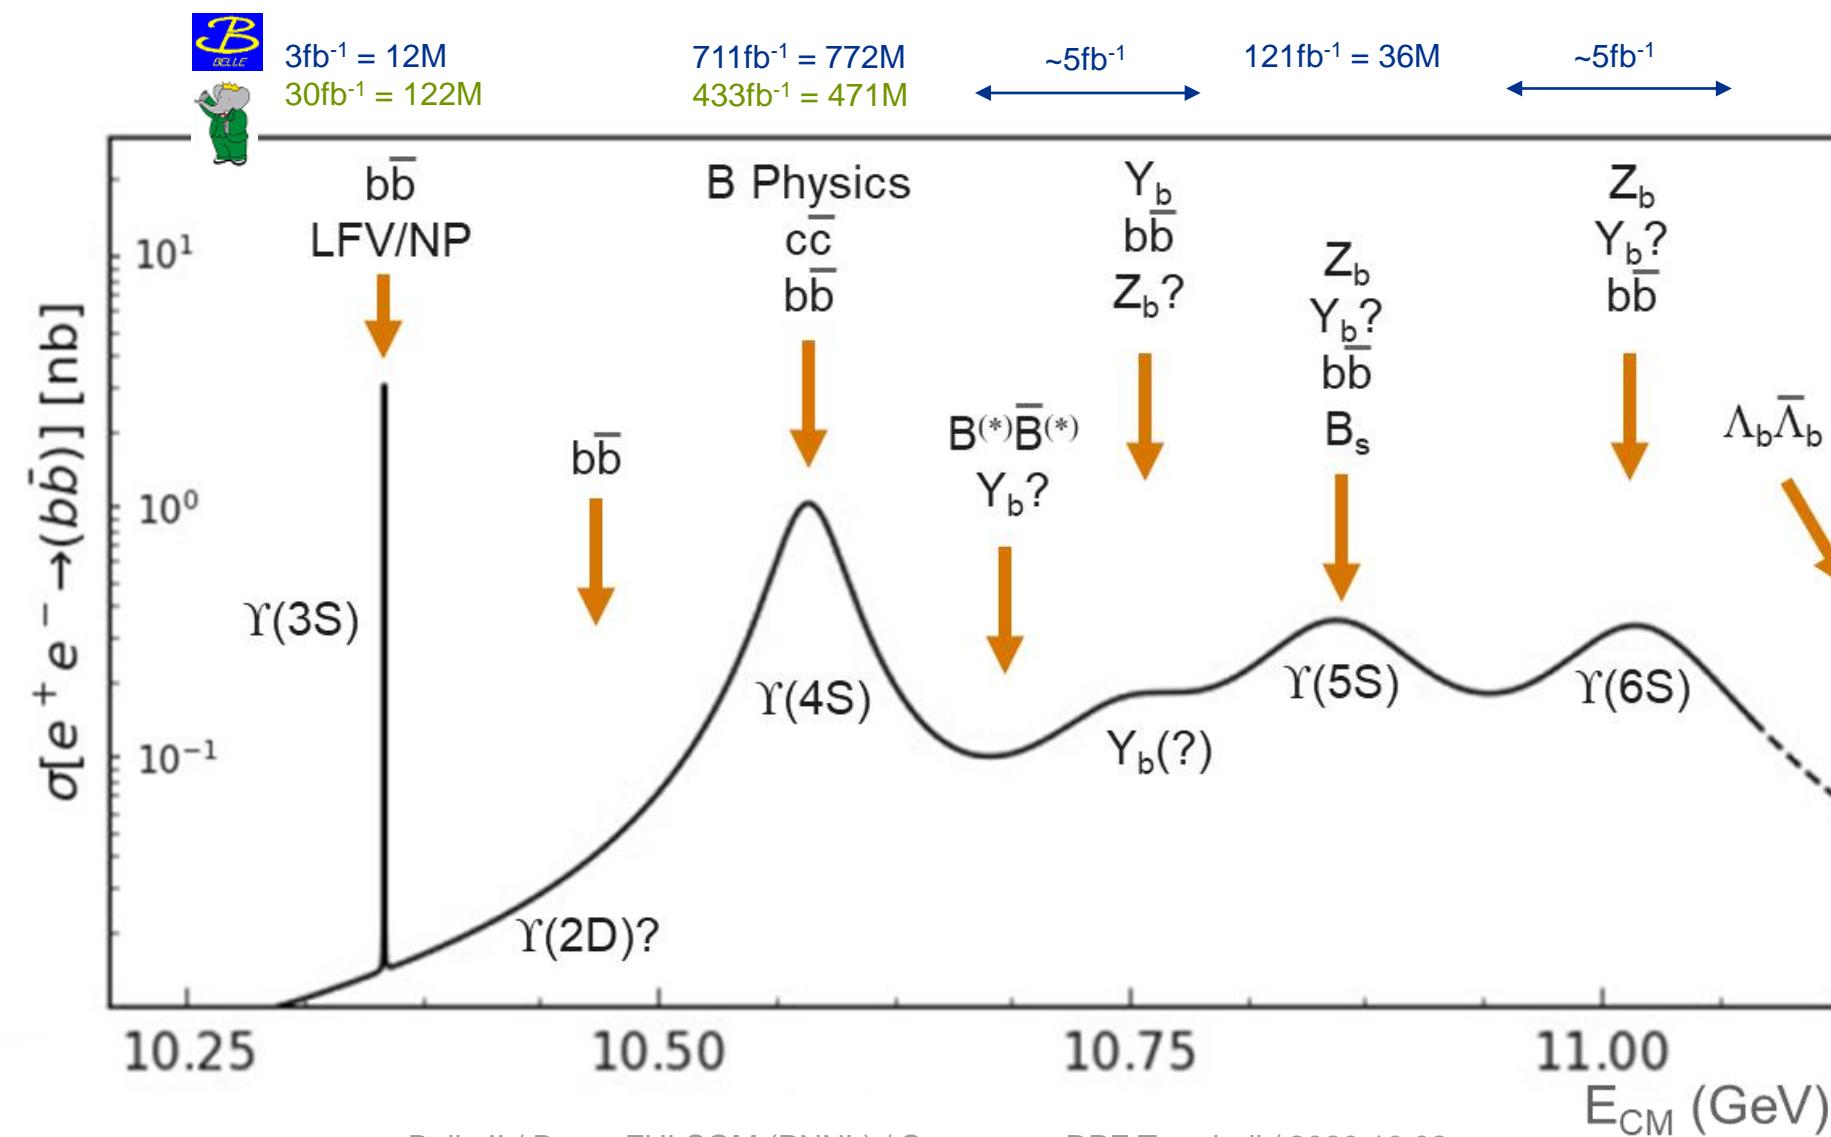

- Conventional

- Large samples of $\Upsilon(4S) \rightarrow \eta h_b(1P)$ to study h_b and η_b
- $E_{CM} = \Upsilon(3S)$ potential for many decay mode measurements
- Searches for missing states (D-, F-wave?) via energy scans or higher E_{CM}

A Question of Beam Energy

- Physics reach potentially extended by running at non- $\Upsilon(4S)$ energies

Summary and Snowmass Context

- Belle II: next generation B-Factory building upon success of Belle
- Wide-ranging physics program including many hadronic spectroscopic studies
- LOI: SNOWMASS21-RF7_RF0_Fulsom-062
- Next steps
 - Belle II Collaboration white paper(s)
 - Input to related LOIs: R7_RF0-082 (hadron-hadron), RF7_RF0-EF6_EF0-083 (diquark)
- Desired outcomes
 - Support/visibility for Belle II activities within the US
 - Reinforcement to Belle II of importance of hadron spectroscopy/exotics physics
 - General support for this area of physics research within US
